Tactical Combat Casualty Care for All Combatants 02 June 2014

Care Under Fire

Objectives

- **DESCRIBE** the role of firepower supremacy in the prevention of combat trauma.
- **DEMONSTRATE** techniques that can be used to quickly move casualties to cover while the unit is engaged in a firefight.
- **EXPLAIN** the rationale for early use of a tourniquet to control life-threatening extremity bleeding during Care Under Fire

Objectives

- **DEMONSTRATE** the appropriate application of the C-A-T to the arm and leg.
- **EXPLAIN** why stabilization of the cervical spine is not a critical need in combat casualties with penetrating trauma to the neck.

Care Under Fire Guidelines

1. Return fire and take cover.

2. Direct or expect casualty to remain engaged as a combatant if appropriate.

3. Direct casualty to move to cover and apply self-aid if able.

4. Try to keep the casualty from sustaining additional wounds.

Care Under Fire Guidelines

5. Casualties should be extricated from burning vehicles or buildings and moved to relative safety. Do what is necessary to stop the burning process.

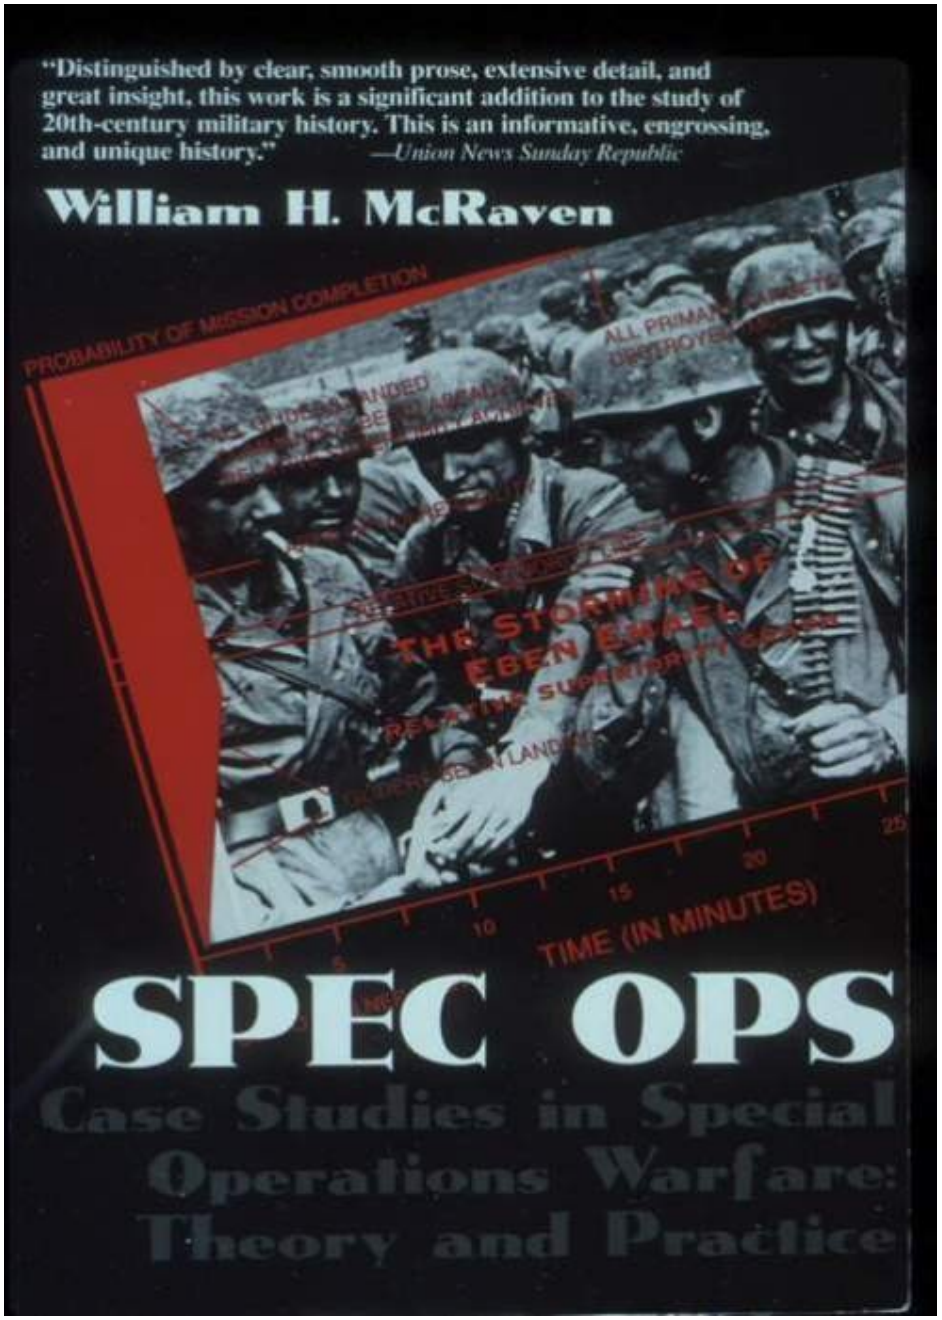
6. Airway management is generally best deferred until the Tactical Field Care phase.

Care Under Fire Guidelines

7. Stop *life-threatening* external hemorrhage if tactically feasible:
   - Direct casualty to control hemorrhage by self-aid if able.
   - Use a CoTCCC-recommended tourniquet for hemorrhage that is anatomically amenable to tourniquet application.
   - Apply the tourniquet proximal to the bleeding site, over the uniform, tighten, and move the casualty to cover.

Care Under Fire

- Prosecuting the mission and caring for the casualties may be in direct conflict.
- What's best for the casualty may NOT be what's best for the mission.
- When there is conflict, which takes precedence?
  - Scenario dependent
- Consider the following example:



"Distinguished by clear, smooth prose, extensive detail, and great insight, this work is a significant addition to the study of 20th-century military history. This is an informative, engrossing, and unique history." —Union News Sunday Republic
William H. McRaven

Case Studies in Special Operations Warfare: Theory and Practice

Raid on Entebbe

by ADM Bill McRaven

- The most successful hostage rescue operation in history
- 27 June 1976
- Air France Flight 139 hijacked
- Flown to Entebbe (Uganda)
- 106 hostages held in Old Terminal at airport
- 7 terrorists guarding hostages
- 100 Ugandan troops perimeter security
- Israeli commando rescue planned

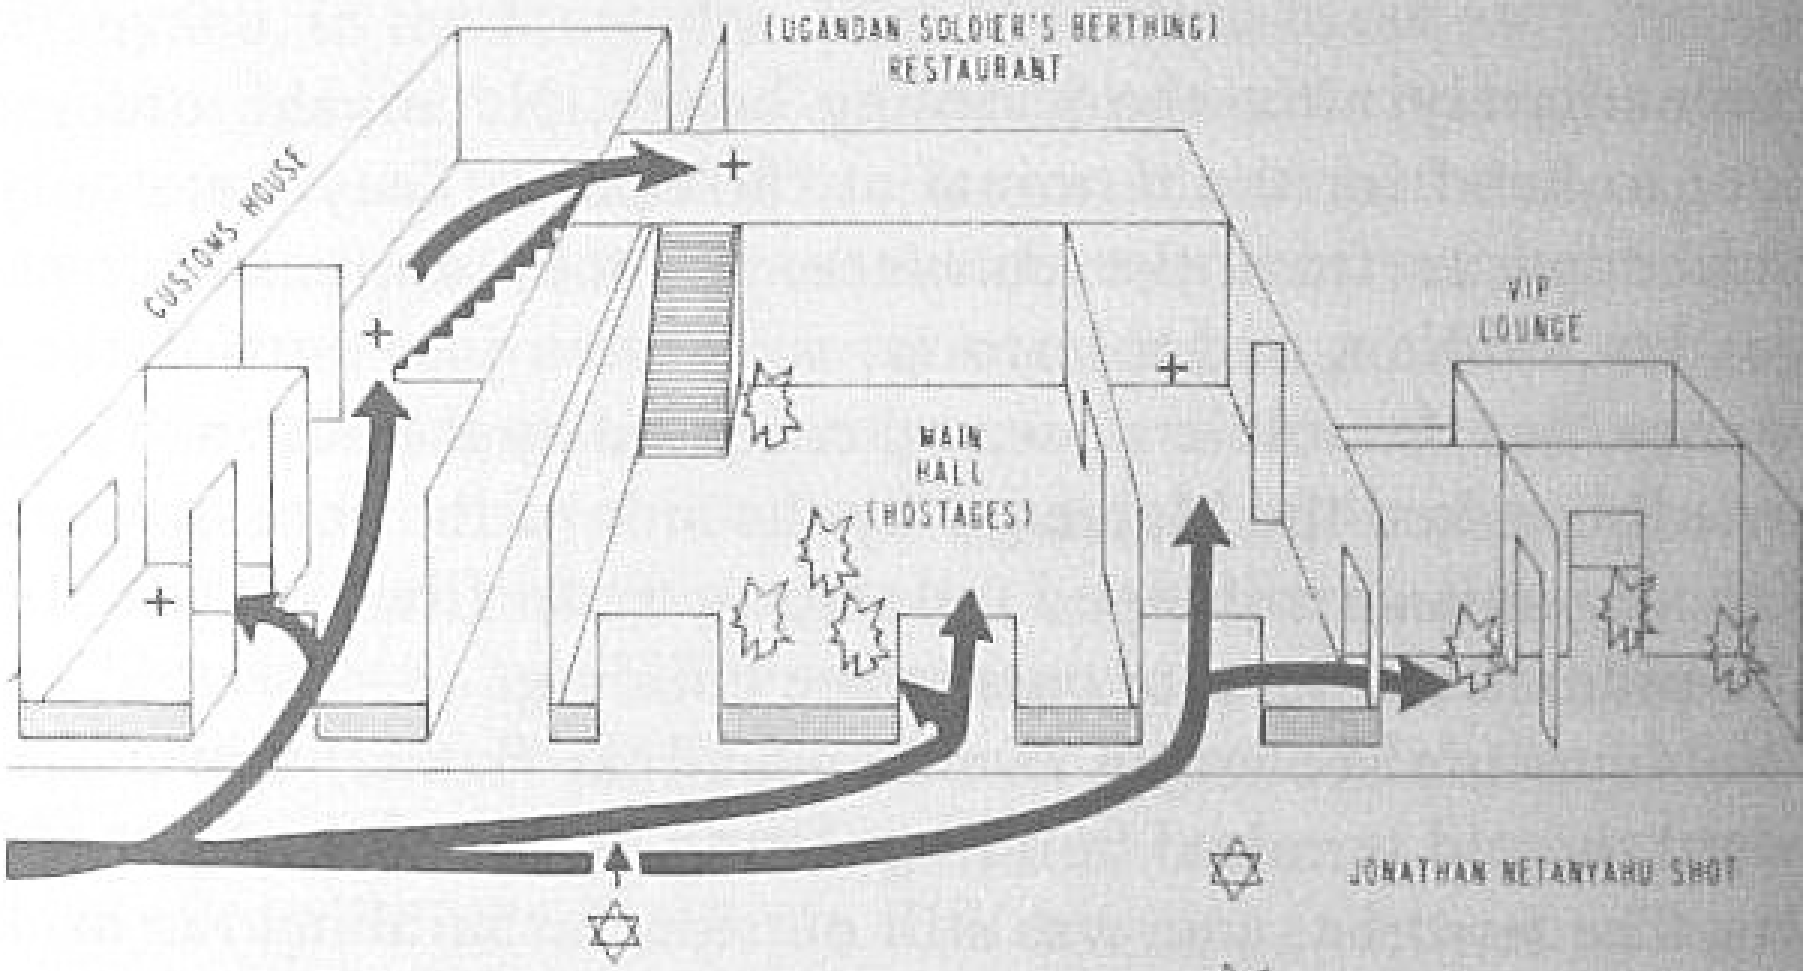
Raid on Entebbe

by ADM Bill McRaven

Rescue 4 July 1976

- Exit from C-130 in a Mercedes and 2 Land Rovers to mimic mode of travel of Idi Amin – the Ugandan dictator at the time
- Israeli commandos dressed as Ugandan soldiers
- Drove up to the terminal - shot the Ugandan sentry
- Assaulted the terminal through 3 doors

OLD TERMINAL ASSAULT



Raid on Entebbe

by ADM Bill McRaven

- LTC Netanyahu – the ground commander – was shot in the chest at the beginning of the assault.
- What would you have done?
  - Disengaged from the assault?
  - Assessed his breathing?
  - Inserted a nasopharyngeal airway?

Raid on Entebbe

by ADM Bill McRaven

"As previously ordered, the three assault elements disregarded Netanyahu and stormed the building."

"<u>At this point in the operation, there wasn't time to attend to the wounded.</u>"

Do seconds really matter in combat?

Ma'a lot Rescue Attempt

by ADM Bill McRaven

- 15 May 1974
- 3 PLO terrorists took 105 hostages
- Schoolchildren and teachers
- When the assault commenced, the terrorists began killing hostages.
- 22 children killed, 56 wounded
- The difference between a dramatic success and a disaster may be measured in seconds.

Care Under Fire

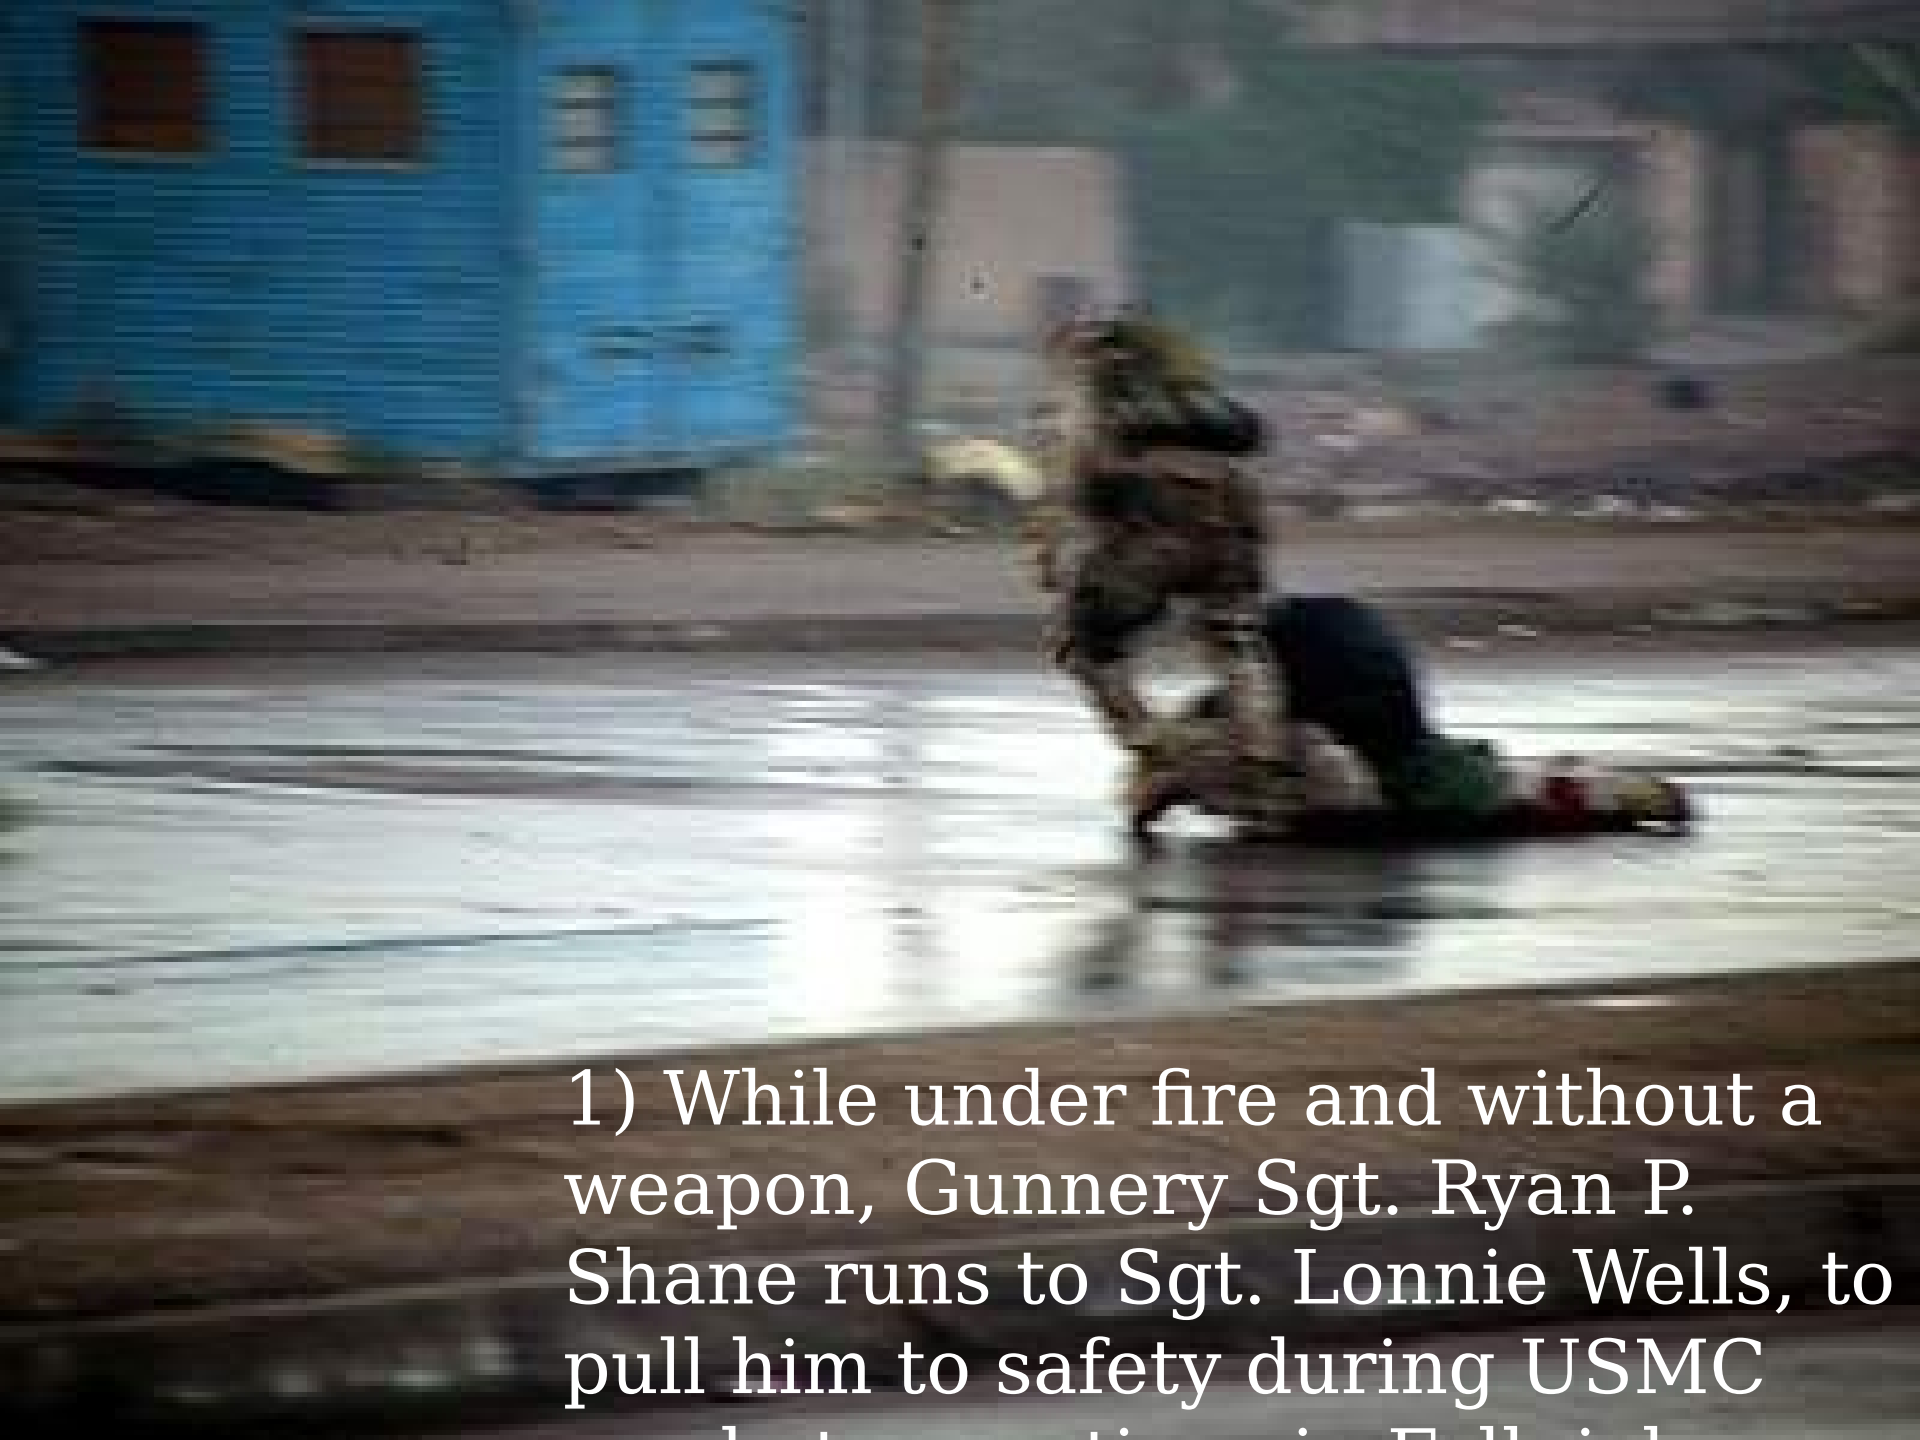
- **If the firefight is ongoing - don't try to treat your casualty in the Kill Zone!**
- Suppression of enemy fire and moving [illegible]over are the major c

Care Under Fire

- Suppression of hostile fire will minimize the risk of both new casualties and additional injuries to the existing casualties.
- The firepower contributed by medical personnel and the casualties themselves may be essential to tactical fire superiority.
- **The best medicine on the battlefield is Fire Superiority!**

Moving Casualties in CUF

- If a casualty is able to move to cover, he should do so to avoid exposing others to enemy fire.
- If casualty is unable to move and unresponsive, the casualty is likely beyond help and moving him while under fire may not be worth the risk.
- If a casualty is responsive but can’t move, a rescue plan should be devised if tactically feasible.
- The next sequence of slides shows the hazards of moving casualties before hostile fire is suppressed

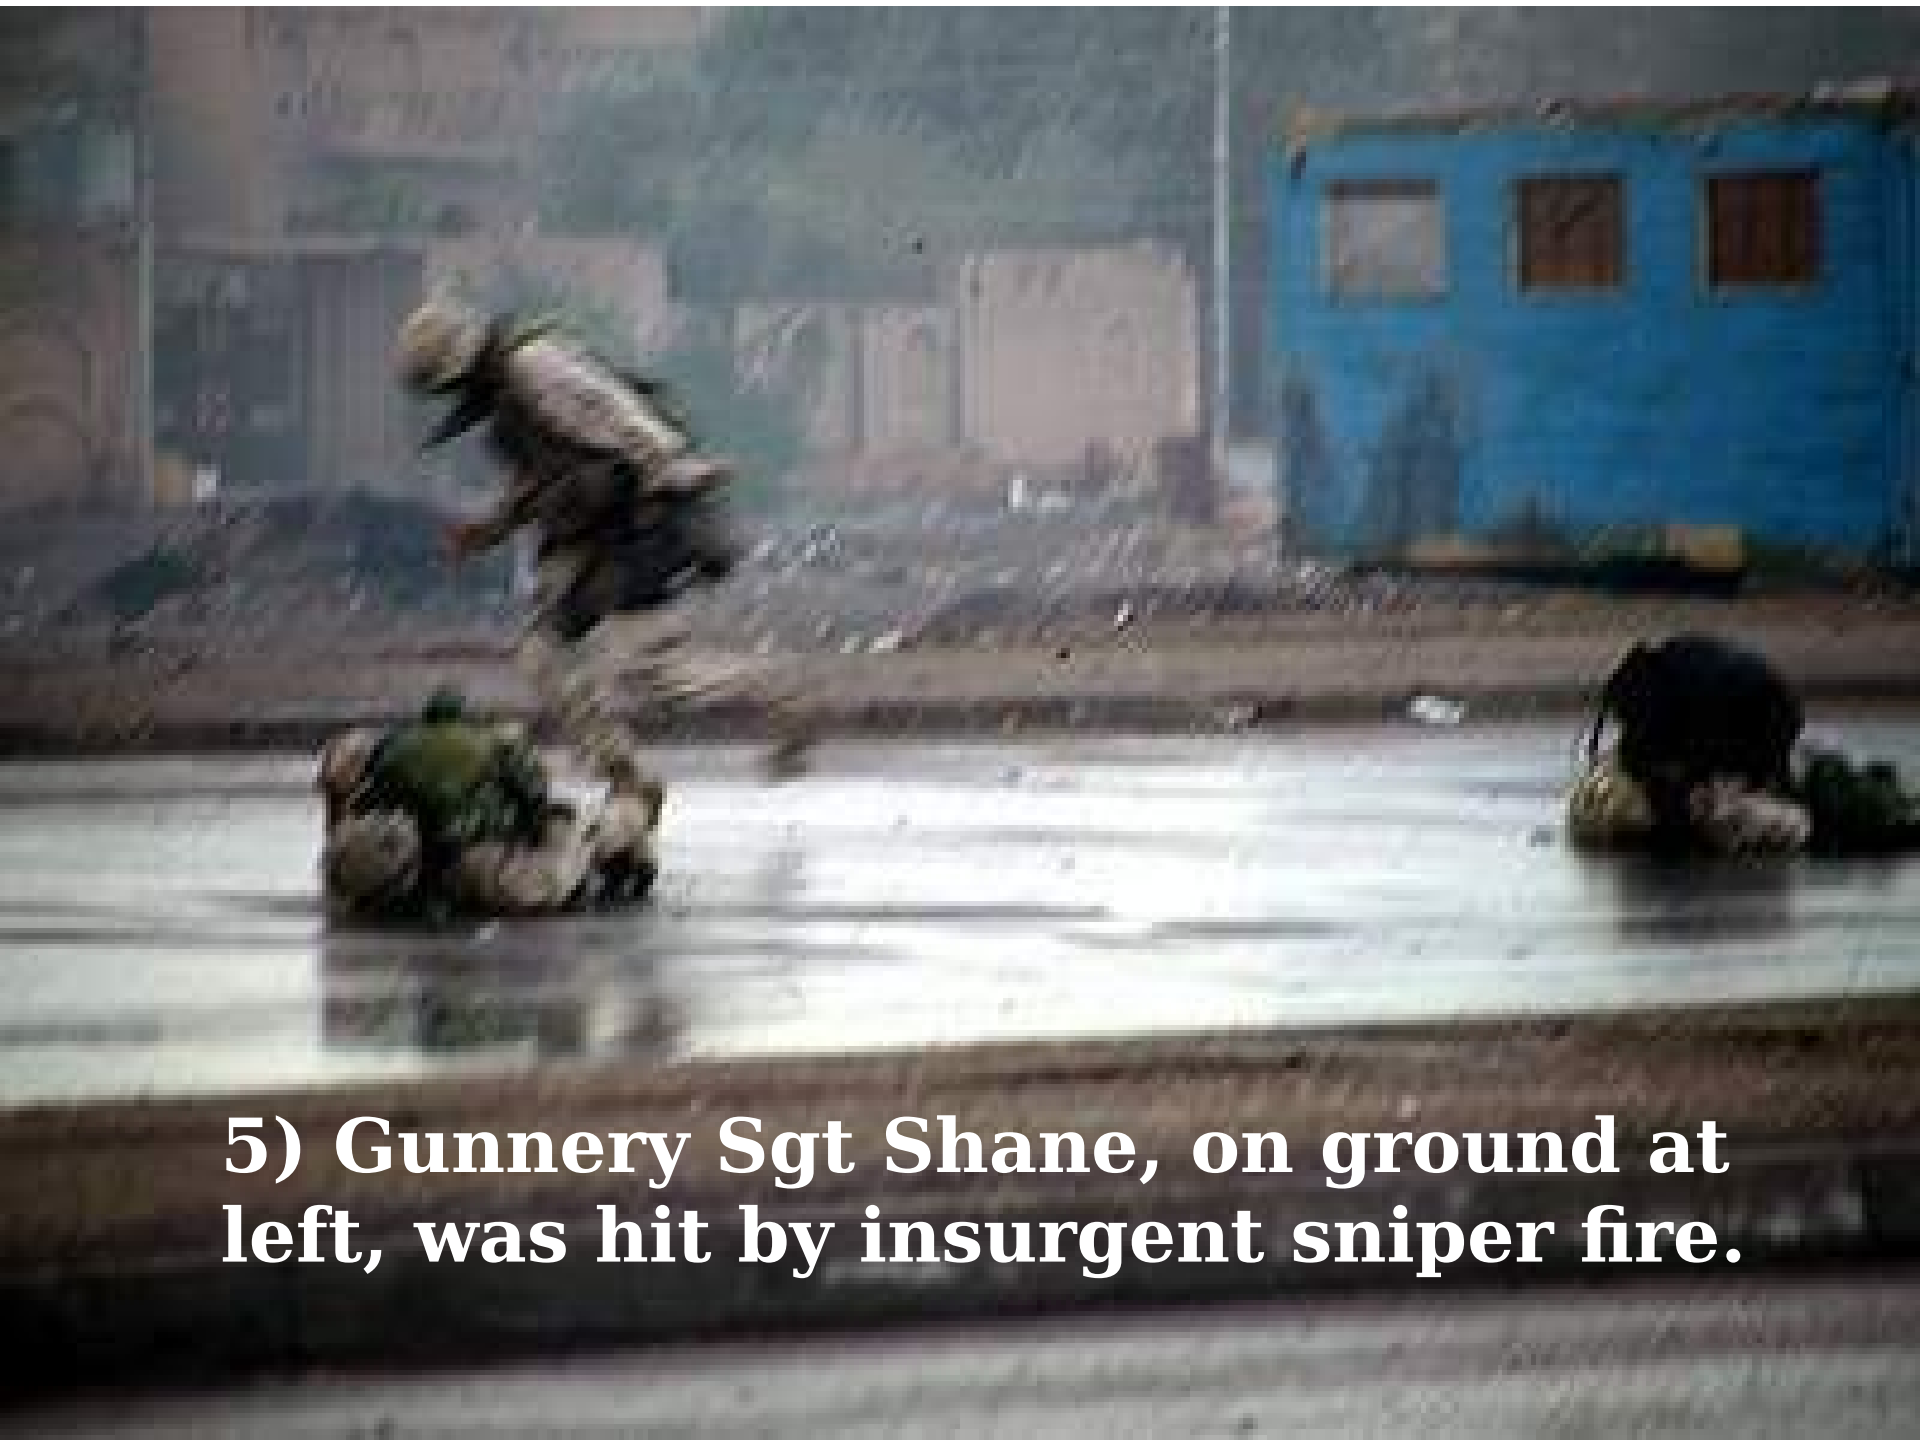


1) While under fire and without a weapon, Gunnery Sgt. Ryan P. Shane runs to Sgt. Lonnie Wells, to pull him to safety during USMC

2) Gunnery Sgt Shane attempts to pull a fatally wounded Sgt Wells to cover.

3) Another comes to help.

4) Gunnery Sgt. Shane (left) is hit by enemy fire.



5) Gunnery Sgt Shane, on ground at left, was hit by insurgent sniper fire.

Casualty Movement Rescue Plan

If you must move a casualty under fire, consider the following:

- **Location of the nearest cover**
- **How best to move him to the cover**
- **The risk to the rescuers**
- **The weight of casualty and rescuer**
- **The distance to be covered**
- **Use suppression fire and smoke to best advantage!**
- **Recover the casualty's weapons if possible**

C-Spine Stabilization

Penetrating head and neck injuries do not require C-spine stabilization like a C-collar.

- Gunshot wounds (GSW), shrapnel
- In penetrating trauma, the spinal cord is either already compromised or is in relatively less danger than would be the case with blunt trauma.
- Either way, you probably won't hurt the casualty further by moving him.

C-Spine Stabilization

Blunt trauma is different!

- **Neck or back injuries due to falls, fast-roping injuries, or motor vehicle accidents may require C-spine stabilization.**
- Medic should apply only if the danger of hostile fire does not constitute a greater threat.

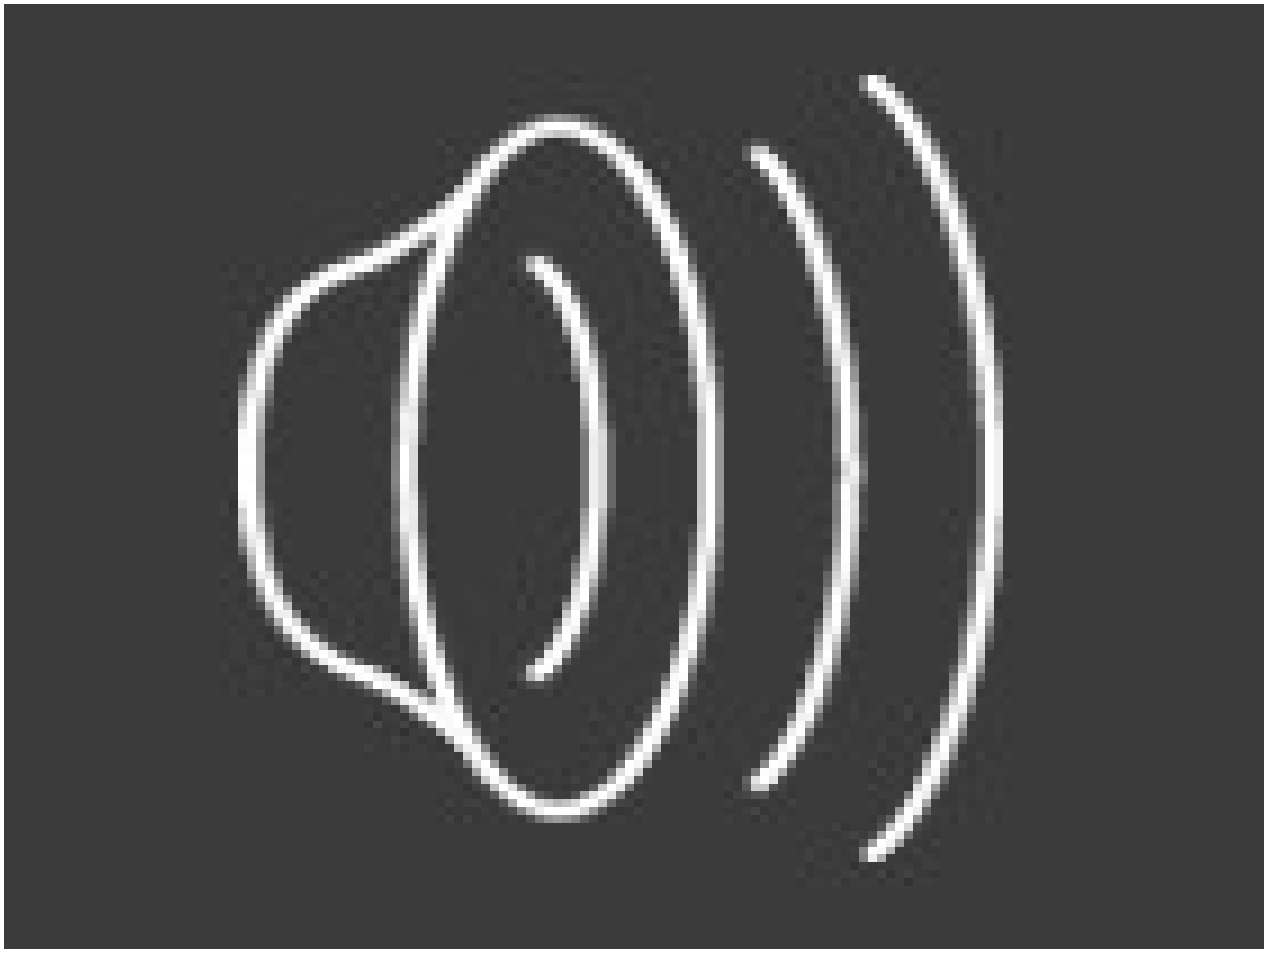
Types of Carries and Drags for Care Under Fire

- **One-person drag with/without line**
- **Two-person drag with/without line**
- **SEAL Team Three C**
- **Hawes Carry**

One-Person Drag

Two-Person Drag

Video: Two-Person Drag



Two-Person Drag Using Lines

Hawes Carry

Carries Practical

How <u>Not</u> to Do It

Burn Prevention in CUF

- Remove casualties from burning vehicles or structures ASAP and move them to cover.
- Stop the burning with any non-flammable fluids readily accessible, by smothering, or by rolling on the

Burn Prevention in CUF

Wear fire-retardant Nomex gloves and uniform!

ght hand of a burn casualty ired by a fire-resistant glove

Fire-Resistant Army Combat Sh

The Number One Medical Priority in CUF

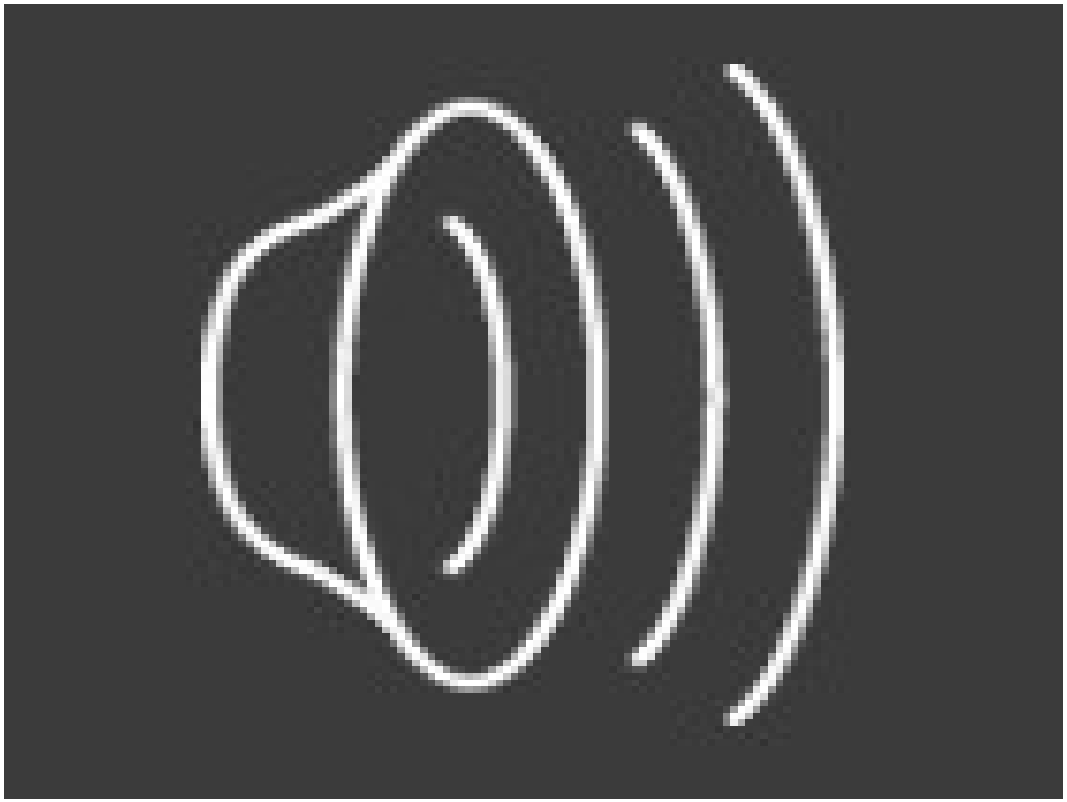
Early control of severe hemorrhage is critical.

- **Extremity hemorrhage is the most frequent cause of *preventable* battlefield deaths.**
- Over 2500 deaths occurred in Vietnam secondary to hemorrhage from extremity wounds.
- Injury to a major vessel can quickly lead to shock and death.
- ***Only life-threatening bleeding warrants intervention during***

Question

- How long does it take to bleed to death from a complete femoral artery and vein disruption?
- Answer:
  - Casualties with such an injury can bleed to death i[illegible] ***inutes.***

Video: Femoral Artery Bleeding



Care Under Fire

The need for immediate access to a tourniquet in such situations makes it clear that all personnel on combat missions should have a CoTCCC-recommended tourniquet readily available at a standard location on their battle gear and be trained in its use.

- Casualties should be able to easily and quickly reach their *own* tourniquet.

Care Under Fire

Where a tourniquet can be applied, it is the ***first*** choice for control of life-threatening hemorrhage in Care Under Fire

A Preventable Death

This casualty did not have an effective tourniquet applied – he bled to death from a leg wound.

Tourniquet Application

- Apply without delay if indicated.
- Both the casualty and the medic are in grave danger while a tourniquet is being applied in this phase – don’t use tourniquets for wounds with only minor bleeding.
- The decision regarding the relative risk of further injury versus that of bleeding to death must be made by the person rendering care.

Tourniquet Application

- Non-life-threatening bleeding should be **ignored** until the Tactical Field Care phase.
- Apply the tourniquet without removing the uniform – make sure it is clearly proximal to the bleeding site.
- Tighten until bleeding is controlled.
- May need a second tourniquet applied just above the first to control bleeding.
- Don’t put a tourniquet directly over the knee or elbow.
- Don’t put a tourniquet directly over a holster

Anatomy of a C-A-T

The Combat Application Tourniquet (C-A-T) is a small and lightweight one-handed tourniquet that can completely occlude arterial blood flow in an extremity.

Combat Application Tourniquet

The C-A-T is Delivered in Its One-Handed Configuration

C-A-T One-Handed Application to an Arm

Step 1: Insert the wounded extremity through the C-A-T.

C-A-T One-Handed Application to an Arm

Step 2: Pull the Self-Adhering Band tight
and securely fasten it back on itself.

C-A-T One-Handed Application to an Arm

Step 3: Adhere the band around the arm. Do not adhere the band past the clip.

C-A-T One-Handed Application to an Arm

Step 4: Twist the rod until the bleeding has stopped.

C-A-T One-Handed Application to an Arm

Step 5: Lock the rod in place in the Windlass Clip.

C-A-T One-Handed Application to an Arm

Hemorrhage is now controlled.

C-A-T One-Handed Application to an Arm

For added security, <u>and always before moving a patient</u>, proceed to secure the Windlass Rod with the Windlass Strap as follows:

C-A-T One-Handed Application to an Arm

Step 6: Adhere the Self-Adhering Band over the Windlass Rod and continue around the extremity as far as it will go.

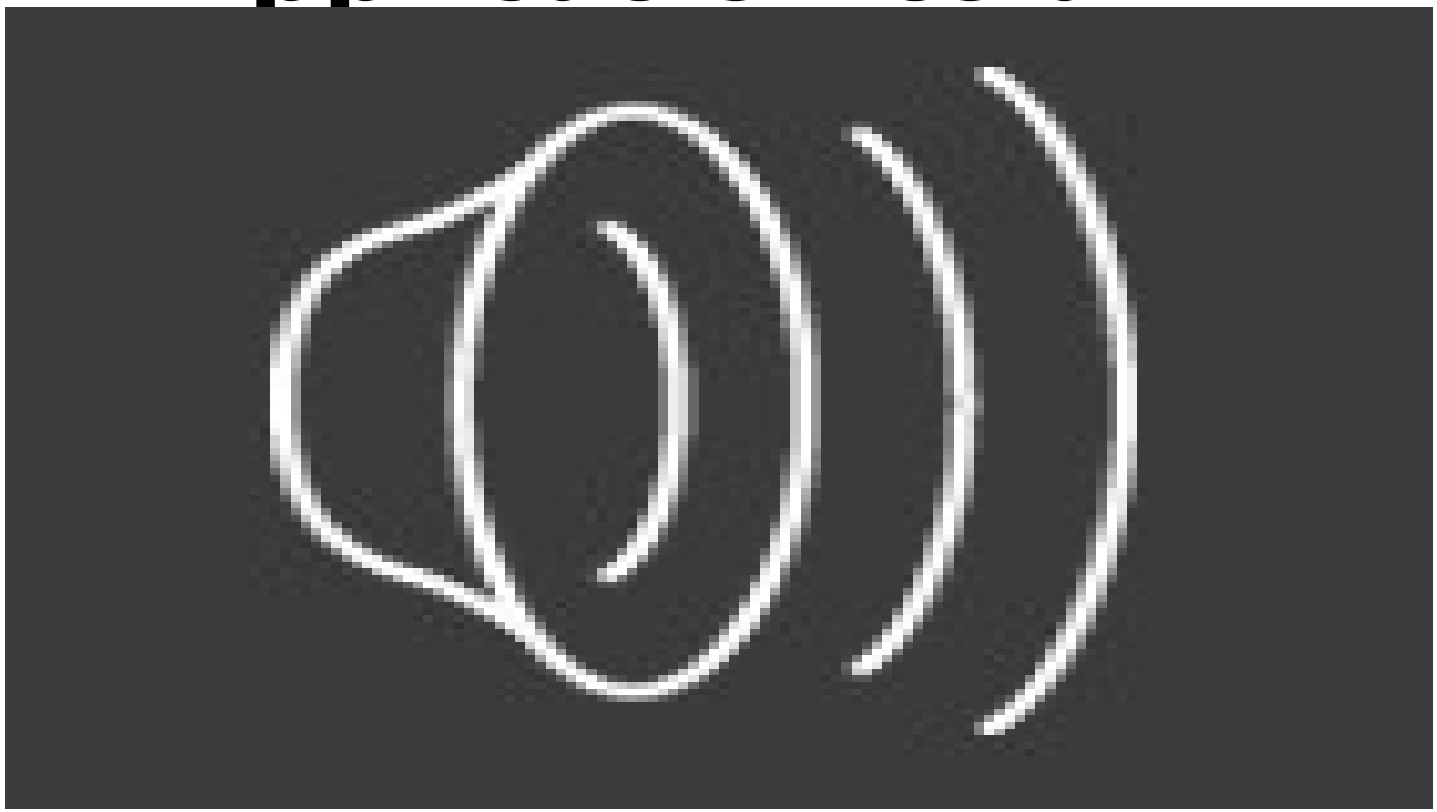
C-A-T One-Handed Application to an Arm

Step 7: Secure the Rod and the Band with the Windlass Strap. Grasp the strap, pull it tight, and adhere it to the opposite hook on the Windlass Clip.

C-A-T One-Handed Application to an Arm

The casualty is now ready for transport.

Video: C-A-T One-Handed Application to an Arm



Video courtesy North American Rescue

C-A-T Two-Handed Application to a Leg

Step 1: Route the Self-Adhering Band around the leg. Pass the free-running end of the Band through the inside slit of the friction adaptor buckle.

C-A-T Two-Handed Application to a Leg

Step 2: Pass the Band through the outside slit of the buckle.

C-A-T Two-Handed Application to a Leg

Step 3: Pull the Self-Adhering Band tight and securely fasten it back on itself.

C-A-T Two-Handed Application to a Leg

Step 4: Twist the Rod until bright red bleeding has stopped.

C-A-T Two-Handed Application to a Leg

Step 5: Lock the Rod in place in the Windlass Clip.

C-A-T Two-Handed Application to a Leg

Hemorrhage is now controlled.

C-A-T Two-Handed Application to a Leg

Step 6: Secure the Rod with the Windlass Strap. Grasp the Windlass Strap, pull it tight, and adhere it to the opposite hook on the Windlass Clip.

C-A-T Two-Handed Application to a Leg

The casualty is now ready for transport.

Wafflephile/Wikipedia

Impact of Tourniquet Use
Kragh - Annals of Surgery 2009

- Ibn Sina Hospital, Baghdad, 2006
- Tourniquets saved lives on the battlefield.
- **Survival was better when tourniquets were applied BEFORE casualties went into shock.**
- 31 lives were saved in this study by applying tourniquets in the prehospital setting rather than in the ED
- **An estimated 1000-2000 lives have been saved in this war to date by tourniquets. (Data provided to Army Surgeon General)**

Safety of Tourniquet Use
Kragh - Journal of Trauma 2008

- Combat Support Hospital in Baghdad
- 232 patients with tourniquets on 309 limbs
- CAT was best field tourniquet
- No amputations caused by tourniquet use
- Approximately 3% transient nerve palsies

Examples of Extremity Wounds That Do NOT Need a Tourniquet

Use a tourniquet ONLY for <u>severe</u> bleeding!

Tourniquet Mistakes to Avoid!

- **Not using one when you should**
- **Using a tourniquet for minimal bleeding**
- **Putting it on too proximally**
- **Not taking it off when indicated during TFC**
- **Taking it off when the casualty is in shock or has only a short transport time to the hospital**
- **Not making it tight enough – the tourniquet should eliminate the distal pulse**
- **Not using a second tourniquet if needed**

***These lessons learned have been written in blood.* ***

- **Waiting too long to put the tourniquet**

Tourniquet Pain

- **Tourniquets HURT when applied effectively.**
- **Pain does not necessarily indicate a mistake in application.**
- **It doesn’t mean you should take it off!**
- **Manage pain with p**
  meds.

Questions?

Tourniquet Practical

Hemorrhage Control

- Some wounds are located in places where a tourniquet cannot be applied, such as the:
  - Neck
  - Axilla (armpit)
  - Groin
- **The use of a hemostatic agent (e.g., Combat Gauze) is generally not tactically feasible in CUF because of the requirement to hold direct pressure for 3 minutes.**

Airway – Covered in TFC

No immediate management of the airway is anticipated while in the Care Under Fire phase.

- Don’t take time to establish an airway while under fire.
- Defer airway management until you have moved casualty to cover.
- Combat deaths from compromised airways are relatively infrequent.
- If casualty has no airway in the Care Under Fire phase, chances for survival are minimal

Summary of Key Points

- Return fire and take cover!
- Direct or expect the casualty to remain engaged as a combatant if appropriate.
- Direct the casualty to move to cover if able.
- Try to keep the casualty from sustaining additional wounds.
- Get casualties out of burning vehicles or buildings.

Summary of Key Points

- Airway management is generally best deferred until the Tactical Field Care phase.
- Stop life-threatening external hemorrhage if tactically feasible.
  - Use a tourniquet for hemorrhage that is anatomically amenable to tourniquet application.
  - Direct the casualty to control hemorrhage by self-aid if able.

Questions?

Scenario Based Planning

- If the basic TCCC combat trauma management plan for Care Under Fire doesn’t work for your specific tactical situation – ***then it doesn’t work***.
- Scenario-based planning is critical for success.
- Incorporate likely casualty scenarios into unit mission planning!
- The following is one example:

Convoy IED Scenario

Convoy IED Scenario

- Your element is in a five-vehicle convoy moving through a small Iraqi village.
- A command-detonated IED explodes under the second vehicle.
- Moderate sniper fire follows.
- The rest of the convoy is suppressing sniper fire.

Convoy IED Scenario

- You are a survivor in the disabled vehicle.
- The person next to you has bilateral mid-thigh amputations. He is your only medic!
- There is heavy arterial bleeding from the left stump.
- The right stump has only mild oozing of blood

Convoy IED Scenario

- The casualty is conscious and in moderate pain.
- The vehicle is not on fire and is right side up.
- You are uninjured and able to assist.

Convoy IED Scenario

First decision:

- Return fire or treat casualty?
  - You treat the immediate threat to the casualty's life.
  - Why?
    - The rest of the convoy is providing suppressive fire.
    - The treatment is effective and QUICK.
- First action?
  - You put a tourniquet on the left stump with arterial bleeding.

Convoy IED Scenario

Next action?

- Put a tourniquet on second stump?
  - Not until Tactical Field Care
  - It’s not bleeding much right now

Next actions?

- Drag the casualty out of the vehicle and move him to the best cover
- Return fire if needed
- Communicate info to the team leader

Questions?
